Patent Pending
Every dental procedure requires the skills of an artist. In fact, today’s dentists are proud to take ownership for creating and restoring individual smiles, putting their personal “fingerprint” on every restoration and crown. Now, dentists can use Bite-Chek articulation film which provides all the information needed to create the best designs for their patients. It’s a tool developed for dentists to help them easily express their individual style.

**Why Bite-Chek?**

- Easy-grip handle requires no forceps.
- No risk of biting forceps.
- No curling, handle holds film flat.
- Handle keeps gloves clean.

**Our Articulation Advantage**

Bite-Chek accurately marks the points of contact, minimizing the possibility of “too high” an occlusion and possible post-operative tooth sensitivity. Contrary to many thicker paper options on the market today, our film’s thin profile helps patients close their bite completely, eliminating mandibular reflexes that can skew the occlusion. The result is a small, accurate mark that makes adjustment easy to interpret.

**Bite-Chek Articulating Film:**

- Thin film marks high points accurately – wet or dry.
- Stretches without snap back or tearing to prevent false marks.
- Marks all surfaces, enamel, metal, non-metal restorations, and plastic.
- Marks both arches at once with its double-sided film.

**Instructions**

1. Dry the tooth surface.
2. Position so film is on the teeth facing the center of the mouth.
3. Check occlusion.
